

SIHHA - SYNTHETIC CARDIOLOGY BRIEF

Cross-signal conversation prompt for OpenAI Build Week judges

DEMONSTRATION ONLY. Every value in this document is synthetic. This brief does not diagnose a rhythm disorder, estimate personal risk, or replace urgent medical care.

1. Why Sihha surfaced a cardiology conversation

Signal	Synthetic evidence	Interpretation boundary
Jogging heart rate	Peak 188 bpm; typical peak 174 bpm during strong jogging	Optical wearable data can show a pattern but cannot classify rhythm or prove danger.
LDL trend	142 -> 129 -> 116 mg/dL; latest value remains above the demo reference of <100	A lipid trend supports prevention discussion but does not explain the heart-rate response by itself.
Combined prompt	Two independent domains merit one prepared conversation	Sihha suggests considering clinician review; it does not issue a diagnosis or treatment plan.

2. Explainable escalation rule

IF	A synthetic exercise peak is at least 180 bpm
AND	A synthetic lipid result remains above its displayed reference
THEN	Prepare a cardiology conversation prompt and a question list
NEVER	Label a diagnosis, infer rhythm type, or recommend medication changes

3. Questions prepared for a clinician

1. Could a resting 12-lead ECG and a symptom-limited exercise ECG help characterize the response?
2. What exercise intensity, symptom stop-rules, and recovery targets are appropriate until evaluation is complete?
3. Should ambulatory ECG monitoring be considered if elevated heart rate also occurs outside logged workouts?
4. How should the LDL trend be interpreted with blood pressure, family history, and the rest of the risk profile?

How Codex contributed

Codex with GPT-5.6 helped design the cross-signal rule, separate evidence from inference, and write the safety boundary. The decision to seek medical care remains with the user and qualified clinicians.

Generated from Sihha's synthetic contest dataset - no real patient record is included.
